I like the code. However, I still do not see too many practical uses.

Therefore: new package UnicodeEx is perhaps a right place where to save it, agreed?

As for future plans, yes, I think that going 32bits is the ultimate solution. Anyway, before that, I would like to see many other things resolved in U++. IMO, RTL support is now the priority in this area. Maybe, if you like to play with language issues, you can invest your spare time there... I do not expect the actual code, rather informations.
