Thank you Matthias+Mirek

Finally I will left TDM 4.4.1 as non-dwarf version makes very slow programs and dwarf version with "Speed" option cannot link the programs. It seems it has to be polished.

To work I have returned to MinGW 4.4.0 using GuiMT concepts and voiding `__thread` in line 10 of `Mt.h`, so that now the programs end well without the `emutls_destroy` problem reported before.

I understand Mirek, but under Windows I do not want to depend only on MSC so I prefer to use something worse than GuiLock `__`, but more portable.

Best regards

Koldo
