You don't really need a template for this. You may create a setter and initialize the converter with proper values. Something like...

struct ConvDict : Convert

```
{
    SqlId TBL ,ID, NAME, CLEARTIME;
public:
    void setValues(SqlId _TBL ,SqlId _ID, SqlId _NAME,int _CLEARTIME)
    {
        TBL = _TBL;
        ID = _ID;
        NAME = _NAME;
        CLEARTIME = _CLEARTIME;
    }
}
```

// ...

The only inconvenient is that you have to call setValues before using converter.
