Hello Guys,

I would like to give some Feedback about the Makefile from OSX.
There is a parsing error in the script on my machine.

```
sh-3.2# make -f Makefile PKG=ide "FLAGS=GUI SSE2 MT SPEED" FAST=n BIN=bin  
EXPORT=Makefile.ide  
Parsing package ide ...  
sed: 2: "1h;1!H;${ g;s/;[\t \x0A ...": RE error: parentheses not balanced  
  Preparing output directory structure ...  
usage: mkdir [-pv] [-m mode] directory ...  
make: *** [prep-dirs] Error 64
```

My personal opinion is to move away from this complicated oldschool make stuff to premake build system since its also very small and much more easier to maintain !

Greeting Reinhold
