1. SQL is a macro, same as calling AppCursor() function. The relevant code:

```
#ifndef NOAPPSQL
```

```
struct AppSql : Sql {  
    void operator=(SqlSource& s) { Assign(s); }  
    void Detach()          { Sql::Detach(); }  
    AppSql() : Sql(NULLSQL) {}  
};
```

```
AppSql& AppCursor();  
#define SQL AppCursor()  
#endif
```

1.2 Use SqlBinary(foo)

2. You can use the field name in the first while loop. Fetching after the last record fetched returns false. Your second while loop will not run.
