Quote:The version of X? I am using pretty new one:

I'm also using the newest possible (but stable) version. Maximizing is not the only problem. The best show starts with compiz enabled. Resizing the window causes intensive flickering and restored maximized window is shifted down (I can't see part of the bottom window and I cant do anything about it (move or maximize)).

But the most irritating problem under gome no matter if compiz is enabled or not is debugging. If I click on the debugged window after a short while the parent window (theide) pops up. Can anyone confirm that?
