Hi begnur,

you can use an 'SqlCtrls' object to achieve what you want.

You can do something like this:

```
SqlCtrls ctrls;
```

```
ctrls(MY_TABLE_Field1, editString1 )  
      (MY_TABLE_Field2, editString2)  
      (MY_TABLE_Field2, editString3);
```

```
void updateDbOnEditString()  
{  
    Sql sql;  
    sql * ctrls.Update(MY_TABLE).Where(MY_TABLE_ID == index);  
}
```

```
void Query()  
{  
    ctrls.Load( MY_TABLE, MY_TABLE_ID == index);  
}
```

This is quite handy to use

Another way is to use an SqlArray object and set EditStrings as the controls for the each string field
