Subject: GridCtrl and SplitterFrame

Hi,

When I add a SplitterFrame to a GridCtrl in a dialog, the GridCtrl still uses the entire original space for its scrollbar.

For example, I want to share the left hand side of my dialog between two GridCtrl objects so I add one to the layout in the layout designer and then I add the splitterFrame to that GridCtrl and add another GridCtrl to the SplitterFrame.

IMO the behaviour should be that the two GridCtrls share the space according to the SplitterFrame which they do but also their scrollbars should do the same too which they don't.

If you need me to I can upload an example but it is very quick and easy to recreate.

Cheers,

Nick
