
Subject: Something wrong with `post_identity()`?

Hi.

When testing example Skylark applications I found a strange issue with app no. 6 (FORM POST). When I fill a form and try to submit it I get redirected to `/submit` subpage, but instead of displaying the text sent by me it displays the "identity error" message. It's caused by `$post_identity()` used in `index.witz` template, with this line removed the application works as expected. What's wrong here?

Best regards,
Piotrek
