Hi Klugier,
How did you diagnose the leak?

As I read it:

mysql_library_end() should be called after the last session close. Not after each session close.

I cannot find any mysql_library_init() call anywhere in Upp.
(Yet still it works)

I need to conclude that these calls are made in DllMain() of MySql.dll when loading and unloading the dll.

Doing it explicitly is imho only relevant for programs that statically link MySql (wich Upp does not).
