Manually? How can it be any easier than this:
BINARY_MASK(scripts, "js/*.js")
BINARY_MASK(styles, "css/*.css")
BINARY_MASK(images, "img/*.jpg")

It would be nice to extend BINARY macro the same way that IMAGE_ID works (to save also name of binary data).

With images you can use GetImlImage(name) to find image by it's name.
