Hi,

I gave a try to new debugging code on a simple program with a memory leak:

```
#include <Core/Core.h>
```

```
int main(int argc, const char *argv[])
```

```
{
```

```
    Upp::MemoryBreakpoint(628);
```

```
    int *ptr = new int(1);
```

```
    ptr = new int(2);
```

```
    delete ptr;
```

```
    return 0;
```

```
}
```

Ide crashes with "Parse error". It makes debugger useless for tracking memory leaks.
