
Subject: plugin/sqlite3 case sensitive name on linux

Probably the person that created this plugin on upp-src-605 works on a windows machine where the case of filenames doesn't matter and created the directory "plugin/sqlite3" instead of "plugin/Sqlite3" and as well ceated the file "plugin/sqlite3/sqlite3.upp" instead of "plugin/Sqlite3/Sqlite3.upp" and in the top of "plugin/Sqlite3/Sqlite3upp.cpp" wrote '#include "sqlite3.h"' instead of '#include "Sqlite3.h"'.

And for some reason that I didn't found yet it doesn't create the schema in linux.

And when trying the upp-src-607-dev3 there is a warning about redefinition of "INT64" in the "Sqlite3Schema.h".

Thanks any way for the great job you've done with Ultimate++.
