Hi koldo,

From my experience, Chameleon works and that's about it. It isn't really designed to be friendly or intuitive, it is just functional. And not documented.

You may start by looking in bazaar/Theme, a package that I created that can load a theme from an external zip file (or a folder). It handles everything form colors to menus and surprisingly still works even though it has not been updated in years. It covers pretty much all the controls so you could use that as a starting point. The external format is a bit random.

In bazaar\Themes\Skulpture.zip and SkulptureStone.zip you can find a slightly half-assed port of a KDE skin.
