Hi Honza,

Thanks for your help

All my database is UTF8... So, effectively, it will not be so easy. I'll see if I can wait that Mirek finishes, or I'll do as Koldo : another column... But before, I'll also see if I can use Koldo's function to remove the accents in association with a sqlite3_create_function()...

@deep :

Thanks for your reply, but in my case it will not be very easy, because the code is to allow users to create their own requests. So, I should probably be obliged to automatically generate a regexp each time... And as sqlite doesn't support regexp, I'll also have to extend it with this support... And as says Honza, this depends also what encoding is used...
