I think it is good point. We can migrate to git as a main development tool for some heavy changes that will require pull requests and we can still use SVN compatibility layer from GitHub <https://help.github.com/en/github/importing-your-projects-to-github/support-for-subversion-clients>. That's seems grate to me. Did you test this approach?

Sincerely,  
Klugier

No need to use GitHub anything for this. I will keep mirroring cron running to push any changes from svn to git and use that repo (or other local, does not matter) to push any changes from git to svn.

That svn->git path works is obvious from the fact that mirror exists. No reason why git->svn should not work, that is why git svn integration tools were build for... (basically to allow git developers use git in organizations with central svn repo, which is sort of exactly our case).

Mirek
