Hello all,

If you're working with the Skylark web framework, or with the native Http* classes, it could be handy to have a reference sheet of HTML5, CSS3 and JavaScript. I took me some time, but I managed to make a ref sheet in my classic style of reference sheets.

Maybe one day it will be part of a web book using U++ framework.
I do believe in a potential using U++ to build blasting fast web servers. All classic web servers today (IIS, Apache, node.js, ...) are wasting clock cycles because they use non x86 compiled code. Could this help datacenter usage? I don't mention web-assembly yet

Have fun with it,
hope you like my work
