We found a solution! If someone is interested, here is the code:

```
#include <Core/Core.h>

/*
================================================================================
  WinNT service example. Based on code found in internet. Here is the original header:

 "You may use Makc <makc.the.great@gmail.com> for credits ;)"

 "Windows service C++ implementation based on MSDN sample by Nigel Thompson (Microsoft
 Developer Network Technology Group) November 1995"

================================================================================ */

#include <windows.h>
#include <winsock.h>
#define snprintf _snprintf
#pragma comment(lib,"ws2_32")
#pragma comment(lib,"advapi32")

#include <stdio.h>
#include <stdlib.h>
#include <time.h>

// windows service class - must be named as "CNTService"! Dont know why - but when you
// rename the class, you can not stop the service (?).

class CNTService
{
public:
 bool Init();
 void Run();

 CNTService(const char* szServiceName);
 ~CNTService();

 bool IsInstalled();
 bool Install();
 bool Uninstall();
```

```
 bool StartService();
 void SetStatus(DWORD dwState);
 bool Initialize();

 static void WINAPI ServiceMain(DWORD dwArgc, LPTSTR* lpszArgv);
 static void WINAPI Handler(DWORD dwOpcode);

 char m_szServiceName[64];
