Hi,
just to let it registered,for novice users, here that using MariaDB v 10.1.33, windows 10, 64 bits, only after declaring
SqlSession & ThrowOnError (true) is that I was really able to catch and handle errors. So as a suggestion I would say that it is almost mandatory to use because otherwise, at least I, I could not handle the error and return through the server. In the manual it says: "if it is active" I would leave it in red: if it is not active, and it is in network it will not make any sense, or suggestion always leave it active and it is not a default.

thanks
