## U++ - Cross-Platform App Development I

U++ is a C++ cross-platform rapid application development framework focused on programmers productivity. It includes a set of libraries (GUI, SQL, etc.), and an integrated development environment.

Rapid development is achieved by the smart and aggressive use of C++ rather than through fancy code generators. In this respect, U++ competes with popular scripting languages while preserving C/C++ runtime characteristics.

The U++ integrated development environment, TheIDE, introduces modular concepts to C++ programming. It features BLITZ-build technology to speedup C++ rebuilds up to 4 times, Visual designers for U++ libraries, a Topic++ system for documenting code and creating rich text resources for applications (like help and code documentation) and Assist++ - a powerful C++ code analyzer that provides features like code completion, navigation and transformation.

TheIDE can work with GCC, Clang, MinGW and Visual C++ and contains a full featured debugger. TheIDE can also be used to develop non-U++ applications.

U++ supports following platforms on the production level: Windows, macOS, GNU/Linux & FreeBSD.

### What you can get with the U++ download in plain English?

- Very effective C++ library for cross-platform development in source form.
- A good integrated development environment, designed for developing large C++ applications.

## U++ - Cro

**U++** is a C++ cross-platform integrated development environment designed to increase programmers productivity.

Rapid development is achieved through a combination of features rather than through fancy code generation or scripting languages which are often slow and unreliable.

The U++ integrated development environment introduces new concepts to C++ programming. It rebuilds up to 4 times, V (code documentation) and code documentation) and

Hello,

with Linux there are troubles!

The browser is detached by the Ctrl 8o

In another post I asked how to attach a GtkWidget to U++ window.  
Please give me some advice fo fix the issue and each platforms will have its Browser embedded.

Thanks,  
Luigi

Now on linux works with a workaround: the browser appear in a popup that follow the geometry of

the ctrl.

I hope to get more info to fix it properly.

Thanks,  
Luigi

Ok, now works on Linux too but as a popup. However the z-order of the popup is kept under control.

Later I'll publish the project and a proposal to do a little modification in GtkCreate.cpp for future development.
