i have a .dll and my .exe uses it. how to link .exe?

if i add the .dll name into Package Organizer, it gets a linkage option -l, which will not search for .dll. it complains that lib...a not found.

Hi,

you normally have an import library with with the same name as the DLL and .lib extension, try to link against this library.

If you don't have an import library, try to find something about its creation in the documentation.

ok. how to convert .dll & .h to .lib?

can U++ do this? because in fact i generate the .dll from C++ code using it.

i saw the post by fudamin, but he said to compile "from outside". did not find this in manual.

thank you.

You need to have a .def file that lists all DLL exports.

This file should have been created and using that you should be able to create an import library.

Try to find something about .def files in the documentation.

Unfortunately, I cannot help you since I am not using VC .

are you implying VC is required? I have not that either.
shouldn't U++ provide a way of using the dll it generates in other packages?

No its is not required.

Are you really sure no .lib has been created beside the .dll? The .lib and the .dll should be in the output directory.

I have no such problems...

Attached is a small project wich builds a "IdleTracker.lib" and a "IdleTracker.dll". May be you can use this as an example. The source is from "Sidney Chong". I just modified it for my needs and made the upp project.

- Ralf

Edit: It works with MSC71 and MSC8 but not with MINGW!

OK. i downloaded impdef and now have .def. but MinGW doc says nothing more of how to use this .def.
i added a library option from U++'s package management, giving the full path of .dll. then bing! it links. and tested on other machine, complaining no .dll found.
but what puzzles me is that after i renamed my .dll, it still runs well on my machine.
if this is ok, i do not need any .def or anything.
