only WhenClosed is TopWindow's CALLBACK. and then the other CALLBACK belonging to Ctrl, Action, seems relevant, but when i resize TopWindow, it is not called.

After reading Ctrl's document, i suppose Layout() is invoked when it is resized. Then do I have to reimplement TopWindow's Layout()?

What about

```
Paint(...);  
?
```

Yes. Layout is called whenever "metrics" change. That includes some other cases over simple resize, e.g. change of Windows theme too, but generally, if you want to setup your internal state based on metrics, it is the right place to do so.

So ctrl resize events can only be caught by overwriting Layout method, right?

Or is there another method that is called if and only if a ctrl (or top window) resize occurs?

---

Matthias

Layout() is good enough for me
