Hello UPP world

I tried to update 2007 version installed on Intel dual core machine with Redhat (Fedora) with 2008.1
But it failed (
The first version was debian, so I tried with upp_2008.1_i386.deb

Which best dowload version to use for my machine configuration ?
And how to process? Can new version cohabit with old one?

Thanks for any help

If you can make 2007 to run, you should maybe consider downloading SVN sources to different directory, and build them in 2007 directly to get latest SVN version of everything.

Both can coexist together, search trough forum a bit, there were some descriptions about how some people setup their directories to have both stable and svn version together.

If you're having problems one way is to just download the source package and replace your old source.

You can then compile the updated TheIde using the old one if you desire.

It is relatively easy to have multiple versions running, especially if you don't want different Ide versions, just the source. You can do this by creating new Assemblies. Right-click the old one you wish to duplicate, selct 'New...' and change the uppsrc path to a directory with a different version in it and change the name. You can probably find more info by searching the forum.

Thank you for your advises.
Of course, just replacing source could be a solution.

Linux is very new for me and many knowledge miss to me. And I think I don't do what it should be.

At first. What is the correct method to install a new version? Just extract archive from root directory? Or is there any script to launch ?

Thanks

Please, could anyone telle me which would be the correct package to install with Fedora distribution :

upp-2008.1-1.fc9.i386.rpm ?
upp-2008.1-1mdv2008.1.i586.rpm ?
upp-2008.1-1.src.rpm ?
suse11.0.i586.rpm ?
upp_2008.1_amd64.deb ?
upp_2008.1_i386.deb ?
upp-freebsd-port-2008.1.tgz ?

Thank you for helping

upp_2008.1_amd64.deb ?
upp_2008.1_i386.deb ?
upp-freebsd-port-2008.1.tgz ?

Well, I use only kubuntu with *.deb packages, but as far as I know, Fedora uses *.rpm so I think "fc9" stands for fedora core 9 (redhat)? It is probably the package your're looking for.
