I`ve met very strange issue while working in FreeBSD 7.1 (XFCE 4.4.2, TheIDE 902r183). Each time I type character inside TheIDE help` keyword search Edit control, default browser, Mozilla Firefox is called (ver. 2.0.0.20) trying to open some unknown page, which fails to load.

Hi,

I don't know what the initial intention was to include it, but you can uncomment call to LaunchWebBrowser in CtrlLib/Help.cpp function HelpWindow::GoTo.

It was reported once here but nobody did anything. May we have a bug report and feature request tracking software as some of the bugs and feature reported in forum get ignored because we get over these posts?

The problem is that about 70% of issues is not a bug in U++, but in client code.

What I do is to scan forums, fix user's bugs, if the issue is U++, I usually fix it immediately.

For unresolved problems, there is special forum.

Anyway, I will check what googlecode (or sf.net) provides...

(Apparently, I have missed that particular post.)

The problem is visible on KDE desktop because calling xdg-open with wrong argument will show a message box with the error. If you test on Ubuntu(Gnome) please launch theIDE from terminal and then see the errors while accessing Help from theIDE.

Quote:/usr/bin/xdg-open
Error showing url: Error stating file '/home/can/ topic:/ide/app/index-us': No such file or directory

It looks like two bugs to me:

- Why it does it on typing characters to help

- link starting with topic: should not launch the browser
