Hi,

I am using the Werner Wenzel's Standard Application UPT to create my applications. It is very useful for me.

Till now, I did not understood yet how hte generated app switch the app language as it supports deutch and english.

Please could some one highlight it for me. Why the modification of the language code switch all the app language?

IS there documentation about this "magic"?

By the way, what i need is a more static method for internationalization. I dont need app language switching on the fly. Instead, I would like to know if UPP has any way to compile applications for several languages. Vc++ has table strings if i remember well.
Hence, at compile time we can choose the target language. How do i implement this?

Many thanks

Alex

See .t files and macro t_("") and then you got the answer
