Subject: [Debugging] Watch global variables

Hello everyone,

I'm trying to watch a global variable during debugging because I want to change it's value and watch it's behaviour...

Unfortunately "Watches" always says "'variableName" undefined'.

I googled and found a very old link from 2005, look here:
Link

Is there any solution?

And if not, how can I fire up the debugger with "devenv", like gprentice says in his first post?

Any hint appreciated...

Thanks in advance.
Nil

push

Got another question, is it possible to rearrange all the windows except the "main" window?

Cause I have 2 Displays and want one only for the source code and the other one for an overview of all packages, source files, variables, console, debug infos, etc...

Grazie mille
