Subject: IML including on multiple headers/cpp files

Hi,

I have been trying to get this thing to work but so far I have no idea how to do it. My problem is as following:

I want to have a separate .h/.cpp combination for every form/window in my application. However, in that case I need to include <iml_header.h> in every header file and <iml_source.h> in every cpp file. The situation here is that eventually on top level, every header file for a form/window will be included in my main window source file. I get tons of errors for multiple redifinitions this way.

Could somebody help me with how to correctly implement this? Thanks in advance!

I'm sorry, although I have been looking for a solution for this a few weeks, I now found it after all.
