Subject: About LabelBox and child widgets

I'm trying to put some widgets inside a LabelBox using the layout designer.

But when I resize the windows, the widgets keep the original positions, even when the LabelBox changes its position.

I'm expecting that LabelBox would act as a "layout container" and the LabelBox and its contents would chonge position on the windows as a whole thing, but it's not what is happening.

Am I missing something? Or there are alternatives ther than LabelBox to do what I need?

Hello,

LabelBox not acts as a container - currently we have not implemented containers. But, It definitely should happens in the future - this is require to move forward on mobile market. However you can emulated it using for example Splitter or ParentCtrl. Moreover, as I remember there was bazaar project that creates simply containers like Grid.

Backing to LabelBox it is a static control and you can simply put content inside it. You need to resize it first. Then put controls like EditField, Lable etc. inside it. There is no magic here. LabelBox can be resize able, so it can easily cover all the window content when the size of window will change.

The classical usage of LabelBox can be spotted in examples/GeoFun/GeFun.lay - About layout. Alternatively, you could look inside TheIde code (uppsrc/ide package). You can find a lot of LabelBox usage in ide.lay file.

Sincerely,
Klugier

Thanks for the info! I'll dig on the code.

Can I have some advice on how to start the development of a container?

Regards from Brazil!

Very interesting code! Gave me some hints about the creation of components.

Thanks a lot for your help.
